Chapter 1

File Index

1.1 File List

Here is a list of all documented files with brief descriptions:

udp.h	The header file include all functions used in program and some enums	3
-----------------------	--	---

Chapter 2

File Documentation

2.1 udp.h File Reference

The header file include all functions used in program and some enums.

```
#include <stdio.h>
```

Macros

- #define [MAX_BUFFER_SIZE](#) 1024
- #define [DEFAULT_PROTOCOL](#) 0
- #define [SENDTO_FLAGS](#) 0
- #define [DEFAULT_PORT](#) 80
- #define [DEFAULT_IP](#) INADDR_LOOPBACK

Enumerations

- enum [CLIENT_ERRORS](#) {
 [INCORRECT_ARG_NUM](#) = -5 , [SERVER_ERROR](#) = -4 , [INCORRECT_PORT](#) = -3 , [INCORRECT_IP](#) = -2 ,
 [CLIENT_CONNECT_ERROR](#) = -1 , [INCORRECT_SOCKET](#) = -1 , [SENDTO_ERROR](#) = -1 }
- enum [CLI_ARGS_COUNT](#) {
 [USR_CLI_DEFAULT_IP_N_PORT](#) = 2 , [USR_CLI_DEFAULT_PORT](#) = 3 , [USR_ALL_ARGS_PASSED](#) = 4 ,
 [SERVER_CLI_DEFAULT_PORT](#) = 2 ,
 [SERVER_ALL_ARGS_PASSED](#) = 3 }

Functions

- int [client_connect](#) (const int ip_addr, const int port)
 function that use UDP protocol to connect to network with passed ip and port
- int [client_cli](#) (const int argc, char *argv[])
 function that handle command line arguments and connect to network by using [client_connect\(\)](#) if arguments is correct.
- int [server_start](#) (int port)
 start listen on chosen port
- int [server_cli](#) (int argc, char *argv[])
 function that handle command line arguments and start server by using [server_start\(\)](#) if argument is correct
- void [write_help](#) ()
 write help if help flag is used (-help)

2.1.1 Detailed Description

The header file include all functions used in program and some enums.

2.1.2 Macro Definition Documentation

2.1.2.1 DEFAULT_IP

```
#define DEFAULT_IP INADDR_LOOPBACK
```

default ip. INADDR_LOOPBACK is localhost ip.

2.1.2.2 DEFAULT_PORT

```
#define DEFAULT_PORT 80
```

default port value

2.1.2.3 DEFAULT_PROTOCOL

```
#define DEFAULT_PROTOCOL 0
```

used as third argument of socket() function

2.1.2.4 MAX_BUFFER_SIZE

```
#define MAX_BUFFER_SIZE 1024
```

max buffer size that server will receive by using recvfrom() function

2.1.2.5 SENDTO_FLAGS

```
#define SENDTO_FLAGS 0
```

flags used in sendto function

2.1.3 Enumeration Type Documentation

2.1.3.1 CLI_ARGS_COUNT

```
enum CLI_ARGS_COUNT
```

Enumerator

USR_CLI_DEFAULT_IP_N_PORT	the value 2 is argument count passed through command line. If the program work like a client, that it require 4 arguments (first argument - the executable name, second is flag to indetify, that program working as client (-client), third - ip address, fourth - port. But last two arguments can be omitted. The default ip address 127.0.0.1 (localhost), default port - 80.
USR_CLI_DEFAULT_PORT	3 argument passed, the only missing one in port. Default port is 80. See also CLI_DEFAULT_IP_N_PORT
USR_ALL_ARGS_PASSED	4 argument passed, including ip address and port number. See also CLI_DEFAULT_IP_N_PORT

2.1.3.2 CLIENT_ERRORS

enum [CLIENT_ERRORS](#)

Enumerator

INCORRECT_ARG_NUM	return value of client_cli() or server_cli() if incorrect number of arguments was passed
SERVER_ERROR	return value of server_start() if error was detected
INCORRECT_PORT	return value of client_cli() if incorrect port was passed
INCORRECT_IP	return value of client_cli() if incorrect ip was passed
CLIENT_CONNECT_ERROR	code of client error that will returned in client_connect() function
INCORRECT_SOCKET	if socket() function get error it return -1
SENDTO_ERROR	if sendto() function get error it return -1

2.1.4 Function Documentation

2.1.4.1 client_cli()

```
int client_cli (
    const int argc,
    char * argv[] )
```

function that handle command line arguments and connect to network by using [client_connect\(\)](#) if arguments is correct.

Parameters

<i>argc</i>	argument count
<i>argv</i>	array of strings

Returns

return INCORRECT_PORT if port number is incorrect, INCORRECT_IP if ip address is incorrect, INCORRECT_ARG_NUM if argument number is incorrect, CLIENT_CONNECT_ERROR if [client_connect\(\)](#) return error, else return 0

2.1.4.2 client_connect()

```
int client_connect (
    const int ip_addr,
    const int port )
```

function that use UDP protocol to connect to network with passed ip and port

Parameters

<i>ip_addr</i>	ip address to connect
<i>port</i>	port number

Returns

return CLIENT_CONNECT_ERROR if socket() or sendto() return error value

2.1.4.3 server_cli()

```
int server_cli (
    int argc,
    char * argv[ ] )
```

function that handle command line arguments and start server by using [server_start\(\)](#) if argument is correct

Parameters

<i>argc</i>	argument count
<i>argv</i>	array of strings

Returns

return INCORRECT_PORT if port number is incorrect, INCORRECT_ARG_NUM if argument number is incorrect, return SERVER_ERROR if [server_start\(\)](#) return error, else return 0

2.1.4.4 server_start()

```
int server_start (
    int port )
```

start listen on chosen port

Parameters

<i>port</i>	chosen port
-------------	-------------

Returns

SERVER_ERROR if a server socket creating error or bind function error has occurred

2.2 udp.h

[Go to the documentation of this file.](#)

```
